New vans sold in Europe: large decrease in CO2 emissions

Average carbon dioxide (CO2) emissions of new vans registered in the European Union (EU) in 2017 were 4.7% lower than in 2016, according to preliminary data published today by the European Environment Agency (EEA). This is the highest annual reduction reported since the regulation to reduce CO2 emissions from light-duty vehicles came into force in 2011.

The average van registered in the EU in 2017 emitted 156.0 grams of CO2 per kilometre (g CO2/km), which is 7.7 grams less than in 2016. This reduction brings the EU average emissions 10.9% below the 2017 target of 175 g CO2/km. This target was already met in 2013. Further efficiency improvements of 6% are still needed to reach the EU's more stringent target of 147 g CO2/km set for 2020. Source/ read more:
